

# ELECTION INTELLIGENCE DATA CENTER

## Proposal for the Development of a Centralized Geospatial & Electoral Data Infrastructure

The Election Intelligence Data Center (EIDC) is proposed as a centralized geospatial and electoral data infrastructure designed to collect, integrate, analyze, visualize and disseminate election-related data at multiple administrative and electoral levels. The initial implementation focuses on Lagos State, integrating historical and current voter-registration and Permanent Voter's Card (PVC) collection data with a comprehensive geospatial database of polling units, wards and Local Government Areas (LGAs) -with an architecture built to scale nationally and internationally.

### Aim

To develop a centralized geospatial Election Intelligence Data Center that integrates electoral statistics, PVC-collection data and polling-unit geospatial information to provide spatial analysis, visualization, automated mapping and decision support -measuring voting strength and electoral readiness from the state level down to the LGA, Ward and individual Polling Unit, and tracking change across cycles (2022 vs 2026).

### Objectives

- a. **Integrate and standardize** voter-registration and PVC-collection data across electoral cycles (2022, 2026).
- b. **Build a geospatial electoral database** linking one consistent hierarchy: State - LGA - Ward - Polling Unit.
- c. **Compute key indicators** -total and highest PVCs collected, collection rate, voter and PVC growth, and uncollected-PVC gaps.
- d. **Visualize voting strength** on interactive maps and automated rankings at LGA, Ward and Polling Unit levels.
- e. **Automate standardized campaign & operational maps** for every ward and LGA -batch-generated and exportable to PDF/PNG.
- f. **Deliver an Election Intelligence Dashboard** and a data-mining unit for planning, targeting, reports and downloadable datasets.

### Expected Outcome

- a. **A single, spatial source of truth** for electoral data -accessible and comparable in one place.
- b. **A clear view of where voters and PVCs are concentrated** -and where collection is lagging.
- c. **Faster, evidence-based planning**, field logistics, monitoring and voter-education activities.
- d. **Automated cartography** replacing manual map production with standardized outputs.
- e. **A scalable foundation** -extendable to all 36 states and to other countries' electoral systems.
